

ABSTRACT

A vacuum cleaner (1) comprising a housing (2) in which a drawer-like compartment (8) can be removably positioned, said compartment comprising a dust chamber (7) for receiving a dust collector which can be arranged in a suction air flow path between a connecting piece (4) of a suction hose (5) or a suction tube and an intake opening (20) of a motor/ventilator unit (21). In order to improve one such vacuum cleaner (1) such that the dust collector (16) can be removed from the vacuum cleaner (1) in a simple, user-friendly manner, the motor/ventilator unit (21) is fixed in the housing and the dust collector (16) can be removed from the suction air flow path by pulling out the drawer-like compartment (8). In this way, the drawer-like compartment (8) can be removed with little expenditure of force.
